

The SV1 features a conical flared top for high performance breathing and is available with contour or flex lower section

SV1 Snorkel Series

SV2 Snorkel Series

SV1 Contour Snorkel Series

SV1 and SV2 Flex colors are designed to complement the award winning Atomic Aquatics SubFrame and Frameless masks. Black/Clear, Reef Red, Professional Blue, Silver, and Neon Yellow.

SV1 Contour snorkels are available in Black/Clear, Reef Red and Neon Yellow.

Pink and Purple are available in the SV2 Series only.

SV1 & SV2

Snorkels

The letters SV stand for Scupper Valve.

How it works:

When the diver clears the SV1/SV2 a small watertight tube located inside the snorkel body keeps the breathing airway path free of collected water droplets. The one way valve or Scupper Valve simply allows water to drain into a lower reservoir each time the diver exhales. The result is a crisp clearing, hydrodynamic, snorkel without being big, bulky, and uncomfortable to use.

SV1 & SV2

Snorkels

SV1 & SV2:

How it works.

The Scupper Valve inside the SV snorkel series works in the same way as the Scupper Valve on a boat. An internal tube **1** located inside the main snorkel body retains a small one way Scupper Flap Valve **2** that allows water to flow past the mouthpiece and out the purge valve, **3** without collecting at the bottom of the breathing passage. The diver simply exhales a small burst of air to clear any water trapped below the mouthpiece, keeping the internal tube airway dry. It's so simple and so effective, we have a Patent Pending.

SV2: High performance design with a Semi-Dry top.

The SV2 combines the Scupper Valve lower section with the sleek looking SV2 Semi-Dry top. The SV2 Semi-Dry top horizontal vents **1** diffuse splashed water **2** that would normally freely enter the snorkel top. The small gaps between the vanes of the vent restrict water speed and droplet size and permit most of the splashed water to exit the special vents **3** without entering the breathing tube. Thus you get less water in your snorkel. The SV2 is the perfect answer for rough or choppy water conditions.

- Quick disconnect snorkel keeper includes 30 degree rotation.
- Sliding snorkel keeper range adjuster allows for accurate placement without constant re-adjusting each dive.
- Atomic Aquatics' international and award winning styling team makes the SV1 and SV2 high performance snorkels something you would be proud to use.

Features and benefits of the SV1/SV2 high performance snorkels.

The Scupper Valve (SV) design is self-draining and delivers crisp, effortless clearing.

- 1** Posi-lock flex retainer secures flex section and mouthpiece.
- 2** Dual silicone mouthpiece prevents over-clenching of teeth that would restrict air flow.
- 3** Rotational mouthpiece with ratchet indicators.

SV1 has a conical flared top for high performance breathing.

SV2 Semi-dry top is designed to limit splashed water from entering the breathing tube.
